

When you look at a trail camera photo it is easy to see the deer in the picture, but there is more in the photo than what meets the eye. What area on the property was it taken?, What weather conditions were present?, Was it a daytime photograph?, Has this buck been observed on the property before?, are all important questions to answer. BuckSpy helps put all the pieces together by allowing you to store images captured by trail cameras, either digital or 35mm, **AND** information about Visual Observations made, in chronological order with its easy to use calendar format and point and click answer system. It combines all the information from your trail camera with the information from your hunting journal for a more complete view of your hunting area. You can create and print your own trail camera albums as well keep detailed information on harvests, habitat improvements made to your property, stand or blind specific information, deer sign found data, general wildlife information and much more. It even generates date filtered reports to show you Buck to Doe ratios, Age Class Structure, Observation Rates, Harvest Data and much more. It will also produce reports detailing your habitat enhancements such as soil test results, liming and fertilization rates, type of plot planted, timber stand improvements etc. Here are some of the features found on BuckSpy Advanced:

- Store trail camera images
- Create Trail Camera Photo Albums
- Tag and Track Individual deer
- Record visual observations
- Record harvest data
- Record general wildlife observations
- Record weather data
- Record habitat enhancements
- Record deer sign found
- Record deer stand information
- Run property summary reports
- Accept future software upgrades

BuckSpy was designed to maximize the investment of your trail camera. Isn't it time to unlock it
